

It's all about the Address!

It's election season and time, once again, for the tsunami of Democrat election fraud. Lawsuits in 23 states have been filed against county election commissions for "unusually high" voter registrations. In other words, Democrats have manufactured phantom voters (as explained in the enclosed article) to rig the elections. Again. Here in Virginia, members of the NCRC and others are involved in a desperate effort to validate the state voter rolls by acquiring and employing proven technology which helps identify ineligible voters by finding ineligible addresses. We don't think it is hyperbole to say that this is an existential threat to Republican candidates, as in the last two national elections, the winners were

**TINA PETERS - COLORADO OFFICIAL
PROSECUTED FOR IDENTIFYING VOTER FRAUD**

decided by mail-in ballots. You simply cannot win if you lose the majority of mail-ins, and that is where the fraud is rampant and increasingly brazen.

Back in the day when Democrats had to rely on ballot box stuffing, the fraud could sometimes be contained by local poll watcher or election worker vigilance (assuming there was a Republican on site). The advent of universal mail-in voting, which allows for the dispensing of ballots to virtually anyone who might have ever lived or been registered in the state, *combined* with essentially no ID verification, guarantees a high percentage of mail-in votes which are invariably heavily biased towards

Democrats. There didn't seem to be a practical counter to this bogus ballot jihad, and efforts to remove even obviously fake voters were met with torrents of lawsuits. This "house-to-house" fighting, as it were, sapped the resources of even the most dedicated Republican committees and not a single election result was overturned. Those who chose to persist, were labeled election deniers and hounded out of office and/or prosecuted.

Fortunately, there is a new game in town in the voter roll database management arena know as **Fractal Technology**. Fractal is a new data analysis technology that is based on open source computer code and built to work with massive

databases, with the potential for running a million times faster than any currently-used voter analysis technology. Learn more here:

<https://www.omega4america.com/videos/>

Fractal technology has been used to build databases for the TSA No Fly list, EBAY, State Farm, Geico and USAA to enable fraud detection. Jay Valentine oversaw those projects and is overseeing the [Omega4America](https://www.omega4america.com/) project for voter rolls in more than 25 states. So far the numbers are staggering and give some insight into the inexplicable results of 2020 and 2022.

Phantom Voters & The Ineligible Address

Most, if not all, voter databases cannot be effectively queried like the information sets generated in a Fractal system. For example, a Fractal database might include a *property tax record* for a voter address or a *DMV registration* for a voter. *Coroner records* have been used to identify dead voters, who, shockingly are almost always Democrats. Due to the contentious issue with voter eligibility (How dare you tell me I can't register in 3 states!), Jay has chosen a more substantive and solidly legal approach. A query in a Fractal system can instantly identify ineligible addresses on a voter roll. An ineligible voter address renders a voter registration invalid under federal and state law. It is easier to challenge an invalid address than to challenge an invalid voter. Wisconsin is leading the charge on that issue. Wisconsin and their fractal team recently delivered to state election officials 50,000 address challenges located in a single county. An invalid voter address is used as a ballot accumulation address for mail-in ballots. Those ballots are collected, completed and voted illegally. Voters registered at invalid addresses are referred to as *phantom voters*.

Fractal has identified, in 25 states, hundreds of thousands of phantom voters registered at office parks, warehouses, RV parks, empty lots, UPS stores, Walmarts, 7-11s, etc. The system has also identified voters who actively vote at the age of 125 years to over 1000 years old! It has identified voters who have been registered in dorms, frat and sorority houses that have been actively voting for over 30 years.

This is just a small sampling of ineligible addresses. Hundreds of thousands of

phantom voters have been found registered at ineligible addresses in the 25 state voter rolls run through the Fractal system. A recent demonstration of the Mississippi voter rolls running in the Fractal system identified 150k ineligible voters. To see a demo on video click on the below link:

<https://www.omega4america.com/videos/>.

A New Kind of Phantom

The Fractal system recently identified illegal aliens registering at homeless shelters, churches or abandoned office space. The illegals do not reside at these addresses. The address is merely used for their voter registration after which they are given a debit card and some food. Then the illegals travel to another jurisdiction and repeat the process.

The Undeliverable Database

All of these address anomalies are aggregated by Fractal to create an [Undeliverable Ballot Database](#) that can be used to flag and challenge addresses that should not receive mail-in ballots.

Virginia

The good news is that Virginia has left the Electronic Registration Information Center (ERIC) for voter roll management, which effectively did nothing to clean voter roles. The bad news is that Virginia hasn't done anything to provide valid voter rolls. Instead, the state instructs it's citizens to be responsible for voter integrity at the county or district level. [Click here to read article](#)

THE GREAT EXIT: Why States are Leaving Politically Driven ERIC and Why M...

Accurate voter rolls are vital for election integrity. ERIC's aim to maintain these lists falls short, and state...

The following is lifted verbatim from the [Virginia Election Integrity](#) Project website - red text and underscore emphasis added.

"CLEANING VOTER ROLLS

The elephant in the election integrity room is the approximately 1 million invalid entries on Virginia's voter rolls.

Virginia is locally administered in most respects, with regards to voter rolls. Because of this, each and every city and county in Virginia must have its voter rolls vetted as thoroughly as possible.

The law backs us up on this, as the Commonwealth's voter rolls were not cleaned 90 days before the federal election, as required by law; and we suspect that this has occurred more than one cycle in a row.

Please coordinate with [your local GOP unit committee](#) on efforts to clean the voter rolls in your city or county. If there is none, start it up yourself! Make it your personal responsibility to make sure your locality has clean voter rolls.”

A few of us have been in touch with Mr. Valentine at [Omega4America](#) and he is very anxious to work with Virginia. Omega can build a system to run the VA rolls in 30-45 days. They would want to cross reference it against Property Rolls in the 3 or 4 largest counties. We have reached out to the Virginia Election Integrity Project with no success. Omega only works with statewide voter rolls. A base cost for a copy of the statewide rolls is \$6000. Additional costs are tagged on, according to sources, once the request is made or when updates are needed. So we are trying to obtain the rolls from other sources such as campaigns. We have reached out to our state Delegate Tim Griffin and Virginia Attorney General, Jason Miyares but have received no response. We have received a prompt response, however, from our VA representative to the RNC, Patti Lyman, and she has put us in contact with someone in Fairfax County who is willing to work with us.

Virginia's rolls will not even be close to clean in November unless we remove ineligible addresses from the rolls. A potential reservoir of phantom voters does not bode well for Republicans in November. **Ballot harvesting and door knocking simply will not cut it.**
